Addressees:

Enclosed, as tables I through VII, are the means and standard deviations for "tar", "nicotine", CO, TPM, water and puff count from the 6th interlab test, carried out between October 1990 and March 1991.

As done previously, the graphs represent each laboratory as a regression line derived from each participant's sample "tar", nicotine, and CO average as a function of each sample's grand mean. Except for two figures, 2 and 5, the ordering of the laboratories' slopes and intercepts on the graph follows the sequence of the lines' right hand termination points.

Sincerely,

William L. Steele
